Project Desciption

FIve API determines if a user drives or flies. It uses properties :

For driveEvent endpoint(user is driving a car and associated with this nodes):

- speed
- timestamp
- lat
- long

For flyEvent endpoint(user is flying in an airplane and associated with this nodes):

- altitute
- air_pressure
- city
- weight

Peak events:

Defining vehicles or people if drives or flies.

1000 people driving at the same time in NYC.

100000 people is on the plane about to land NYC.

Users:

SMS provider would like to send an advertisement, it may want to now if GPS is available.

An airline may want to send in-flight information , so may want to check if the passenger is in the plane.

A traffic police department would like to send notification about and accident to driving users.
